

## A way to create a slide show on your Web page

Modify photos by cropping and using color balance, save to 4 inches wide and 72 dpi, and upload with FTP software to Grindstone Web site. **Make sure all photos are the same width and depth or you will end up with a jerking motion between pictures.** IMPORTANT: Place photo files inside your story\_pages “images” folder.

Change permissions to 755 or 0755 (depending on Mac system) or do your webupdate on Windows so photos are published to the Web.

Use browser to call up <http://www.barelyfitz.com/projects/slideshow/wizard/> and follow directions. I recommend you click on the “Play the Video Demo” in the upper right-hand corner of the site for a video of instructions.

Although Step 1 says “optional,” type in the base URL of [http://www.unm.edu/~grind/story\\_pages/images/](http://www.unm.edu/~grind/story_pages/images/) (make sure you include final slash).

Set slide duration to 6000, and check-mark the controls panels to previous, next, play and stop.

In the “Edit your slides section,” type in the photo file name, type in the Web site link to [http://www.unm.edu/~grind/story\\_pages/images/](http://www.unm.edu/~grind/story_pages/images/) (make sure you include final slash), and in the “description” box write your cutline. Again, to avoid a jerking motion, make sure all cutlines end up the same number of lines when they’re displayed in Dreamweaver. You can ignore the “link target” and “window images” boxes.

Make sure the image of your picture shows beneath the “slides” window. If it doesn’t show, you’ve done something wrong. You might need to reload the barelyfitz page to and start all over to make it work if you have a mistake.

Click the “Add Slide” button for your first slide. For each new slide, change the name of the photo file and the cutline and click the “Add Slide” button.

Generate the HTML coding; select and copy that HTML coding. Minimize the barelyfitz window in case you need to come back and update any slides.

Call up your Dreamweaver story page, and in the right hand column type “Slide Show” and hit return. Go to “split” window in upper left corner and find where cursor is located. Make sure you click where the cursor is inside that coding window. Then paste HTML coding from barelyfitz. Return to “design” window. Save and preview on browser.

Update slides on barelyfitz if necessary.
