

Chapter 2: Thinking like an Economist
Principles of Economics, 5th Edition
N. Gregory Mankiw
Page 1

1. Every field has its own language and its own way of thinking.
 - a. The single most important purpose of this book (*course*) is to help you learn the economist's way of thinking.

2. The Economist as Scientist
 - a. Economists try to address their subject with a scientist's objectivity.
 - b. The scientific method: observation, theory, and more observation.
 - i. Because it is a social science, economists have less control over their data than natural scientists.
 - ii. While teaching, economists attempt to use historical examples.
 - iii. In research, economists attempt to correct for other forces.
 - c. The role of assumptions
 - i. Assumptions can simplify the complex world and make it easier to understand.
 - ii. Assumptions can vary based on the question being asked.
 - (1) It is reasonable to assume prices are sticky in the short run, while assuming that they are flexible in the long run.
 - iii. Theories are judged by their results rather than the realism of their assumptions.
 - d. Economic models
 - i. Economists use models to learn about and illustrate the world.
 - ii. These models are most often composed of diagrams and equations.
 - iii. Our first model: The circular flow diagram is a visual model of the economy that shows how dollars flow through markets among households and firms. P. 24
 - (1) There are two types of decision makers: firms and households
 - (2) There are two markets: goods and services and factors of production.
 - (3) Goods and services flow in one direction and money in the other.
 - (4) **Figure 1: The Circular Flow. P. 25**
 - iv. Our second model: The production possibilities frontier is a graph that shows the various combinations of output that the economy can possibly produce given the available factors of production and the available production technology. P. 26
 - (1) **Figure 2: The Production Possibilities Frontier. P. 26**
 - (2) It illustrates the potential for inefficient outcomes.
 - (3) This illustrates the important principle of economics that most choices involve tradeoffs (opportunity costs).
 - (4) Efficiency and tradeoffs.

Chapter 2: Thinking like an Economist
Principles of Economics, 5th Edition
N. Gregory Mankiw
Page 2

- (5) **Figure 3: A Shift in the Production Possibilities Frontier. P. 28**
- (6) The production possibilities frontier simplifies a complex economy to highlight some basic but powerful ideas: scarcity, efficiency, trade-offs, opportunity cost, and economic growth.
- e. Microeconomics and Macroeconomics
 - i. Def: Microeconomics is the study of how households and firms make decisions and how they interact in markets. P. 28
 - ii. Def: Macroeconomics is the study of economy wide phenomena, including inflation, unemployment, and economic growth. P. 28
 - iii. Microeconomics and macroeconomics are closely intertwined.
 - iv. Ultimately, all decisions are made by individuals, so microeconomics is the basis of all economics.
 - v. **FYI: Who Studies Economics? P. 29**
- 3. The Economist as Policy Maker
 - a. Positive versus normative analysis
 - i. Def: Positive statements are claims that attempt to describe the world as it is. P. 30
 - ii. Def: Normative statements are claims that attempt to prescribe how the world should be. P. 30
 - b. Economists in Washington
 - i. *If President Truman wanted to find a one armed economist, he probably should have checked with some of my friends.*
 - ii. *In 1981-2, I was a Senior Staff Economist on the President's Council of Economic Advisers.*
 - iii. **In the News: Football Economics, p. 32**
 - (1) Using incremental analysis to determine when to punt.
- 4. Why Economists' Advice is Not Always Followed
 - a. *Mankiw, who was Chairman of the Council of Economic Advisers under President Bush, is way too kind.*
 - b. *Politicians often make decisions based on self interest, which is frequently reflected in the parties from whom they have received campaign contributions, or the group of voters from whom they want support in the future.*
- 5. Why Economists Disagree
 - a. There are two basic reasons:
 - i. Economist may disagree about the validity of alternative positive theories about how the world works.

N. Gregory Mankiw
Page 3

- (1) *The difference between assuming prices are rigid or flexible.*
 - (2) *Whether individuals will save more with a consumption tax depends on how savings responds to it return.*
 - ii. Economists may have different values and, therefore, different normative views about what policy should try to accomplish.
 - (1) *While much of economics suggests a limited role for the government, many economists vote for candidates who argue for a larger role in the economy for the government.*
 - (2) *Let's face it: most academics are liberal.*
 - b. Perception versus reality
 - i. There is much more agreement among economists than is commonly recognized.
 - ii. **Table 1: Ten Propositions about Which Most Economists Agree. P. 35.**
 - iii. **In the News: Environmental Economics, P. 37.**
 - (1) Many economists are finding jobs working on environmental projects within the government and the not for profit sectors.
6. Let's Get Going
7. Summary
8. Appendix Graphing: A brief review
 - a. *This is for your benefit as you are not responsible for appendices unless I say so.*
 - b. Graphs of a single variable
 - c. Graphs of two variables: The coordinate system.
 - i. **Figure A-1: Types of graphs. P. 40.**
 - d. Curves in the coordinate systems
 - i. **Figure A-2: Using the coordinate system. P. 41.**
 - ii. **Table A-1: Novels purchased by Emma, P. 42.**
 - iii. **Figure A-3: Demand curve, P. 43.**
 - iv. **Figure A-4: Shifting demand curves. P. 44.**
 - e. Slope
 - i. **Figure: A-5: Calculating the slope of a line. P. 45.**
 - f. Cause and effect
 - i. Omitted variables
 - (1) **Figure A-6: Graph with an omitted variable. P. 47.**
 - ii. Reverse Causality
 - (1) **Figure A-7: Graph suggesting reverse causality. P. 48.**
