The Internet and other forms of information and communication technology (ICT) such as word processors, Web editors, presentation software, and e-mail are regularly redefining the nature of literacy. To become fully literate in today's world, students must become proficient in the new literacies of ICT. Therefore, literacy educators have a responsibility to effectively integrate these technologies into the literacy curriculum in order to prepare students for the literacy future they deserve.

The International Reading Association believes that much can be done to support students in developing the new literacies that will be required in their future. We believe that students have the right to

- teachers who are skilled in the effective use of ICT for teaching and learning;
- a literacy curriculum that integrates the new literacies of ICT into instructional programs;
- instruction that develops the critical literacies essential to effective information use;
- assessment practices in literacy that include reading on the Internet and writing using word-processing software;
- opportunities to learn safe and responsible use of information and communication technologies; and
- equal access to ICT.

Expanding our conception of literacy

New literacies are rapidly generating in order to effectively exploit the potentials of ICT (Karchmer, in press; Kinzer & Leander, in press; Labbo, 1996; Leu, 2000a; Luke, 2000; Reinking, McKenna, Labbo, & Kieffer, 1998; Warschauer, 1999). New information and communication technologies also make possible new instructional practices. Thus, traditional definitions of reading, writing, and viewing, and traditional definitions of best practice instruction—derived from a long tradition of book and other print media—will be insufficient.

Although there are multiple ways to view the changes in literacy emerging from new technologies (Labbo & Reinking, 1999), it is not possible to ignore them. We need only to consider the experience of students who graduate from secondary school this year to see how literacy is changing. Graduates began their school career being taught the literacies of paper, pencil, and book technologies. Many will finish their secondary school careers familiar with the new literacies demanded by a wide variety of ICT: word processors, CD-ROMs, Web browsers, Web editors, presentation software, e-mail, instant messaging, and many others unimagined at the beginning of their schooling. Because of rapid changes in technology, it is likely that students who begin school this year will experience even more profound changes in their literacy journeys. Moreover, this story will be repeated again and again as new generations of students encounter yet unimagined information and communication technologies and develop yet unimagined new literacies.

The changes to literacy are unprecedented in several respects. First, they are defined by regular and continuous change; the new literacies of today will be replaced by even newer literacies tomorrow as new information and communication technologies continuously emerge (Leu, 2000a). Second, the changes to literacy are taking place with breakneck speed; no other technologies of literacy have entered school classrooms so rapidly, including the technologies of television, telephones, paper, pencil, or even books. Finally, networked ICT such as the Internet includes the most powerful capabilities for information and communication we have ever seen, permitting access to people and information in ways and at speeds never before possible. Such changes have important implications for instruction, assessment, and research. The literacy community needs to quickly turn its attention to these profound changes.

The Internet is rapidly entering nearly every classroom in developed nations around the world.

The Internet and other ICT have become powerful new tools in the classroom as nations seek to prepare children for their future in an information age. Nations such as Australia, Finland, Ireland, New Zealand, the United Kingdom, the United States, and others are developing public policies to ensure that classrooms have an Internet computer and appropriate software, ICT is integrated into the curriculum, and teachers are prepared for the effective integration of these new technologies into the classroom (Leu, 2000b; Leu & Kinzer, 2000). Some nations have developed websites to support teachers as they integrate Internet technology into the curriculum (see, for example, Ireland’s ScoilNet [http://www.scoilnet.ie/]; Australia’s EdNa [http://www.edna.edu.au/EdNa/]; Canada’s SchoolNet/Rescol [http://www.schoolnet.ca/home/]; United Kingdom’s National Grid for Learning [http://www.ngfl.gov.uk/index.html]; and New Zealand’s Te Kete Ipurangi [http://www.tki.org.nz/]). Because of these public policy initiatives, many nations will soon have an Internet computer in every classroom. In the United States, for example, 77% of K–12 classrooms had at least one computer with an Internet connection in the fall of 2000 (Cattagni & Farris, 2001). Developments such as these demand from literacy educators a vision that includes ICT within the literacy curriculum.

Equity of access to Internet and other ICT will ensure literacy opportunities for children around the world.

In many countries, a pattern similar to one in the United States exists: Nearly twice as many classrooms in wealthier U.S. schools have Internet computers as do poorer schools (NCES, 2000). Continuation of this trend in societies that profess egalitarian ideals presents an important threat to these societies’ long-term political stability. The problem is even greater in developing nations, where classroom Internet access is only a dream. Will this lead to a widening gulf between haves and have-nots around access to information afforded different
We must pay particular attention to developing the critical literacies these technologies demand.

Open information networks, such as the Internet, permit anyone to produce any amount of information. Yet, until recently, the power and potential of this opportunity was not being realized. Open information networks, such as the Internet, permit anyone to produce any amount of information. Yet, until recently, the power and potential of this opportunity was not being realized. Open information networks, such as the Internet, permit anyone to produce any amount of information. Yet, until recently, the power and potential of this opportunity was not being realized. The use of new information and communication technologies in the classroom is essential to provide students with the skills required by new forms of ICT. As Reinking and colleagues (1994–98) have pointed out, changes taking place to the technologies of literacy will enable us to better understand the rapid changes taking place in the nature of literacy and literacy instruction. Although studies of literacy and technology are gradually beginning to emerge in the research journals of literacy, the paucity of hard data in this area remains too obvious (Reinking, McKenna, Labbo, & Kieffer, 1999). This task is large, involves literacy in such profound ways, and must be accomplished so quickly that all literacy researchers need to consider how they might contribute. They should consider bringing their special area of expertise to the study of literacy within the new media of information and communication in order to address major issues, but especially the following: What new literacy skills are required by new forms of ICT? How can we best support students in acquiring these new literacies?

Recent public policy debates on reading and technology instruction will address a central point: When students complete their school careers, much of their reading will take place within ICT such as the Internet.

Our responsibilities

What can we do to make sure that students are prepared for their literacy future? The International Reading Association recommends the following:

Recommendations for Teachers

• Take full advantage of professional development opportunities in technologies such as the Internet.
• Systematically integrate ICT into other ICT in thoughtful ways into the literacy curriculum, especially in developing the critical literacies essential to effective information use.

References

Recommendations for Teacher Educators

• Integrate effective instructional models that use the Internet and other technologies into preparation programs in literacy education.
• Show preserve and in-service teachers, through your own practice, how the new literacies of ICT are an essential component of the curriculum.
• Provide opportunities for other teachers to practice using age-appropriate ICT in field experiences with K–12 children.
• Include online resources in your instructional program.
• Advocate for the inclusion of Internet and other technologies into state reading and writing assessments.
• Advocate for the establishment of an institution or agency to help teachers implement ICT in their classroom literacy instruction.

Recommendations for School Administrators

• Ensure that 30% of your district’s technology budget be devoted to staff development in effective use of technology.
• Support initiatives to provide staff development in integrating ICT into the curriculum.
• Ensure that the new literacies of the Internet and other ICT are integrated within assessments of reading and writing proficiency.
• Expand definitions of reading to include locating, critically evaluating, using, and communicating information in networked information environments such as the Internet.

Recommendations for Researchers

• Bring your particular area of expertise to researching effective ICT use so as to better inform policy makers and educators about how best to support new forms of ICT.
• Carefully examine the critical definitions of literacy that are changing as well as the implications of these changes for research and development.
• Conduct research that identifies the new skills, strategies, and insights essential for successful literacy performance within different information and communication technologies.
• Conduct research that identifies effective instructional strategies for developing proficiency with different information and communication technologies.

Recommendations for Parents

• Inquire as to how your district and school integrate ICT into the reading and writing curriculum.
• Support district initiatives to provide up-to-date technology resources and staff development in the effective use of ICT.
• Support Internet use at home, especially by younger children.
• Become aware of age-appropriate Internet sites and software for use at home and in schools.

Recommendations for Policy Makers

• Support initiatives that guarantee Internet access for schools and libraries.
• Support initiatives that provide funding for staff development and teacher education in integrating and other technologies into the literacy curriculum.
• Ensure that the new literacies of the Internet and other ICT are integrated within assessments of reading and writing proficiency.
• Expand definitions of reading to include locating, critically evaluating, using, and communicating information in networked information environments such as the Internet.

Recommendations for Research

• Develop and disseminate new literacy assessment measures that reflect the integration of ICT.
• Regularly read professional publications such as books, journals, and online journals to stay current on the research and on practical ideas for using technology to improve students’ literacy learning.

Professional development: A link to the new literacies of ICT
